

Money Corrected Milk

The brand new **Money Corrected Milk** (MCM) report is a tool to compare the value of milk produced by individual cows and how cows relate to one another with income over feedcost. MCM is calculated using regional average milk and feed pricing which is entered monthly by DRMS. The computer makes feed adjustments for each individual cow based on milk output and feed intake needed for her level of milk production and components.

The following column headings will be new to you on the MCM Report:

**CUR
TD
MCM**

Current Testday Money Corrected Milk This column, to the right of the actual testday milk, shows the equivalent amount of milk made when adjusted for *value* based on components and component prices.

**PROJ
305
MCM**

Projected 305 Day Money Corrected Milk This column, to the right of the actual 305 day projection, shows the equivalent amount of milk made when adjusted for *value* based on components and component prices.

**DAILY
IOFC\$**

Daily Income Over Feedcost This column shows the component-adjusted value of the cow's milk after subtracting the cost of feed to produce that milk. This is a better culling tool than milk production alone.

NOTE: You will receive the new Money Corrected Milk report free thru May 2017.

If you find this report useful and would like to continue receiving it, please ask your DHIA technician to keep the MCM Report on your report options or let them know to take you off the option (The cost will be 1 cent/cow/month)
